## Treatment recommendations

Based strictly on the results of these studies, surgery does not seem beneficial for patients with basal ganglia or thalamic ICH. Surgery may be most beneficial when reserved for patients with subcortical ICH who are less than 60 years of age without a profoundly impaired level of consciousness at presentation. Given the considerable variability in methodology and numbers of subjects (ie, statistical power), these observations and implied guidelines should not be considered definitive.

## Conclusions

The present prospective study provides insight concerning predictors of death after primary ICH given a population-based perspective. Knowledge of such prognostic factors is imperative in clinical decision making for an individual patient and in designing trials and new treatment strategies for patients with primary ICH. Apart from a patient's level of consciousness on admission, hematoma volume and location, and patient age, which have been previously reported as independent predictors of death in more selected patient, the present study also identified a history of heart disease as a significant determinant of the 30-day mortality rate.

# DERIVAÇÃO VENTRICULAR EXTERNA

# Referência

**MOHR e cols., 1983, 1986.**

“Mais importante do que a ocupação, parcial ou total, dos ventrículos cerebrais pela hemorragia dos aneurismas rotos, foi a avaliação do grau da dilatação das cavidades parenquimatosas intracranianas.”

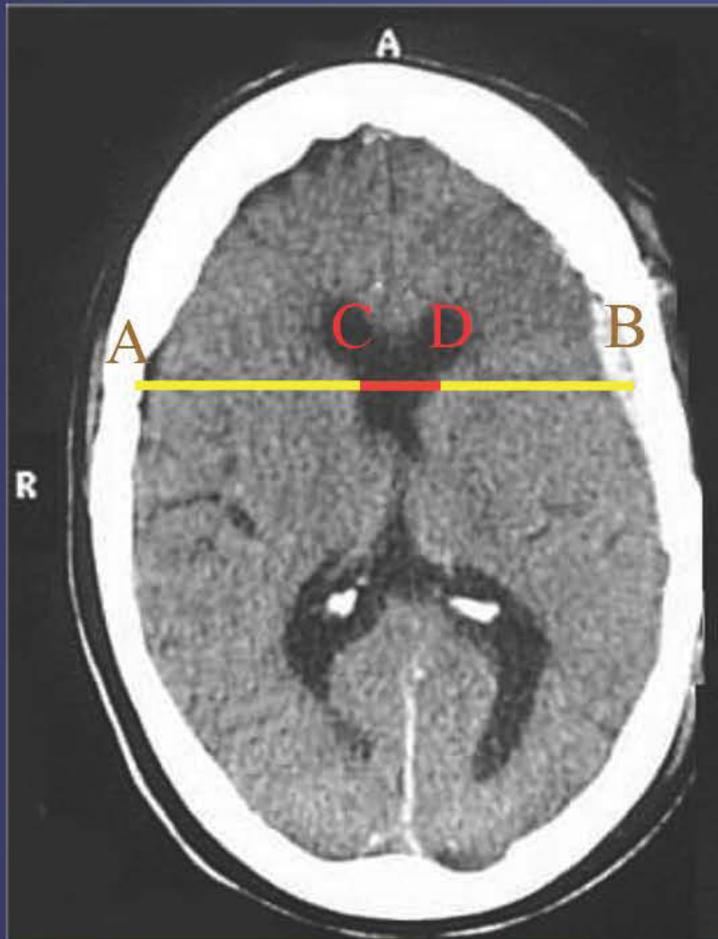

Propuseram o *Índice Bicaudado* para a avaliação do prognóstico dos pacientes com hemoventrículo.

O limite superior normal deste índice tomográfico é de 0.15.

Todos os pacientes que apresentaram Índice Bicaudado igual ou superior a 0.25 morreram.

# Índice de Mohr

$$\text{Índice Bicaudado} = \frac{CD}{AB}$$

Normal  $\leq 0.15$

# Objetivos

**Avaliar a importância do IM na urgência da Hidrocefalia Aguda**

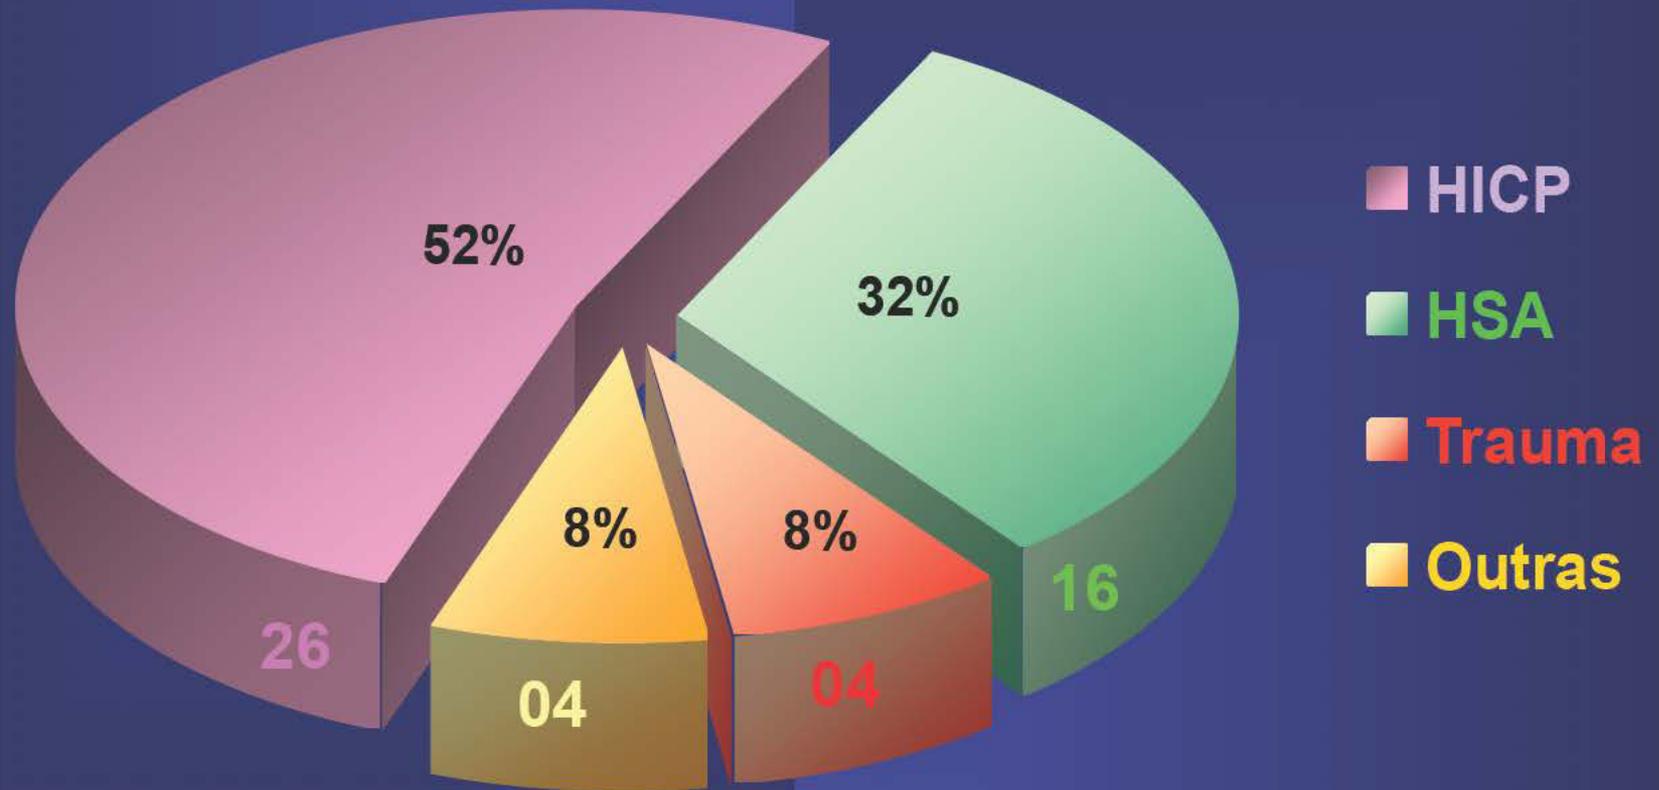

**Correlacionar os valores desse Índice com os resultados obtidos**

**Obter um rápido e confiável parâmetro para escolha do  
tratamento**

**Propor o método que permita proporcionar melhor prognóstico**

**Índice Bicaudado**

## Conclusões:

1. O IM não é isoladamente indicador de cirurgia.
2. O IM fornece expectativa prognóstica.
3. O IM importa para se expressar a Hidrocefalia.
4. A Tríade Tomográfica se baseia em:

a - Índice de Mohr

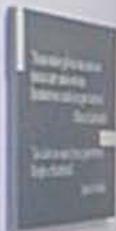

b - Sulcos Corticais

c - Cisternas Basais
